SPECIAL EMPHASIS: CONSERVATION IN THE DOMINICAN REPUBLIC

THOMAS WIEWANDT

Ricord's Iguanas (*Cyclura ricordii*) are the focus of an extensive conservation and educational effort in the southwestern Dominican Republic (see article on p. 222).

ROBERT POWELL

Leiocephalus personatus is one of several lineages of terrestrial Hispaniolan lizards with ranges that terminate at a sharp ecotone near the city of Bani in the Dominican Republic (see article on p. 234).

GUNTHER KOHLER

The Utila Anole (*Norops* [*Anolis*] *utilensis*) occurs only in a few mangrove forests on the Honduran Bay Island of Utila. It may be the world's most endangered anole (see article on p. 240).

JOHN BINNS

Many Monitor Lizards (*Varanus* spp.) become large, are fierce, and require substantial space and care; they are definitely not appropriate for beginning hobbyists; this is a Red Dwarf Monitor (*V. acanthurus brachyurus*) (see article on p. 246).

JOHN BINNS

Rhinoceros Iguanas (*Cyclura cornuta*) remain locally abundant in a few locations in the Dominican Republic, but many populations appear to be declining (see related article on p. 222, travelogue on p. 256, historical perspective on p. 263, and inside the back cover).
