At midday on 17 October 2014 at the Ecolodge on Saba (17°37'47"N, 63°13'52"W; elev. 397 m), we observed an adult male Saba Anole (*Anolis sabanus*) with a conspecific juvenile in its mouth (Fig. 1). When first seen, the juvenile was still alive, but it showed no signs of life as the adult carried it away after being disturbed by our presence. We did not observe ingestion. This is the first report of cannibalism in this species. Cannibalism is not uncommon in West Indian anoles (Gerber 1999, Henderson and Powell 2009), with 18 (now 19) species known to eat conspecifics (Table 1).
